

LIVE TECHNICAL DEMONSTRATION

The Next Display Layer

A live preview of Amazon DCV's future on Linux.

Engineered in collaboration with NI-SP GmbH

Remote desktop experts · AlmaLinux M&E SIG

WHY NOW

Linux workstations are evolving

The way studios build Linux workstations is changing fundamentally — and the legacy display layers the industry leaned on are reaching the end of their road.

Legacy is closing out

The display foundations pipelines were built on are being retired industry-wide.

Studios are modernizing

Teams are transitioning toward a modern desktop future across the fleet.

The protocol must keep up

Enterprise-grade, high-performance remote access can't regress in the transition.

THE CONSTANT IN THE EQUATION

Amazon DCV · 2025.0

A high-performance remote display protocol for secure access to remote desktops and creative application sessions — the proven backbone studios already trust.

Low latency, high fidelity

Built for interactive, color-critical creative work over the network.

WebAuthn authentication

Hardware security keys — YubiKey, Windows Hello — inside the session.

Linux ARM client

Broader client reach and performance across architectures.

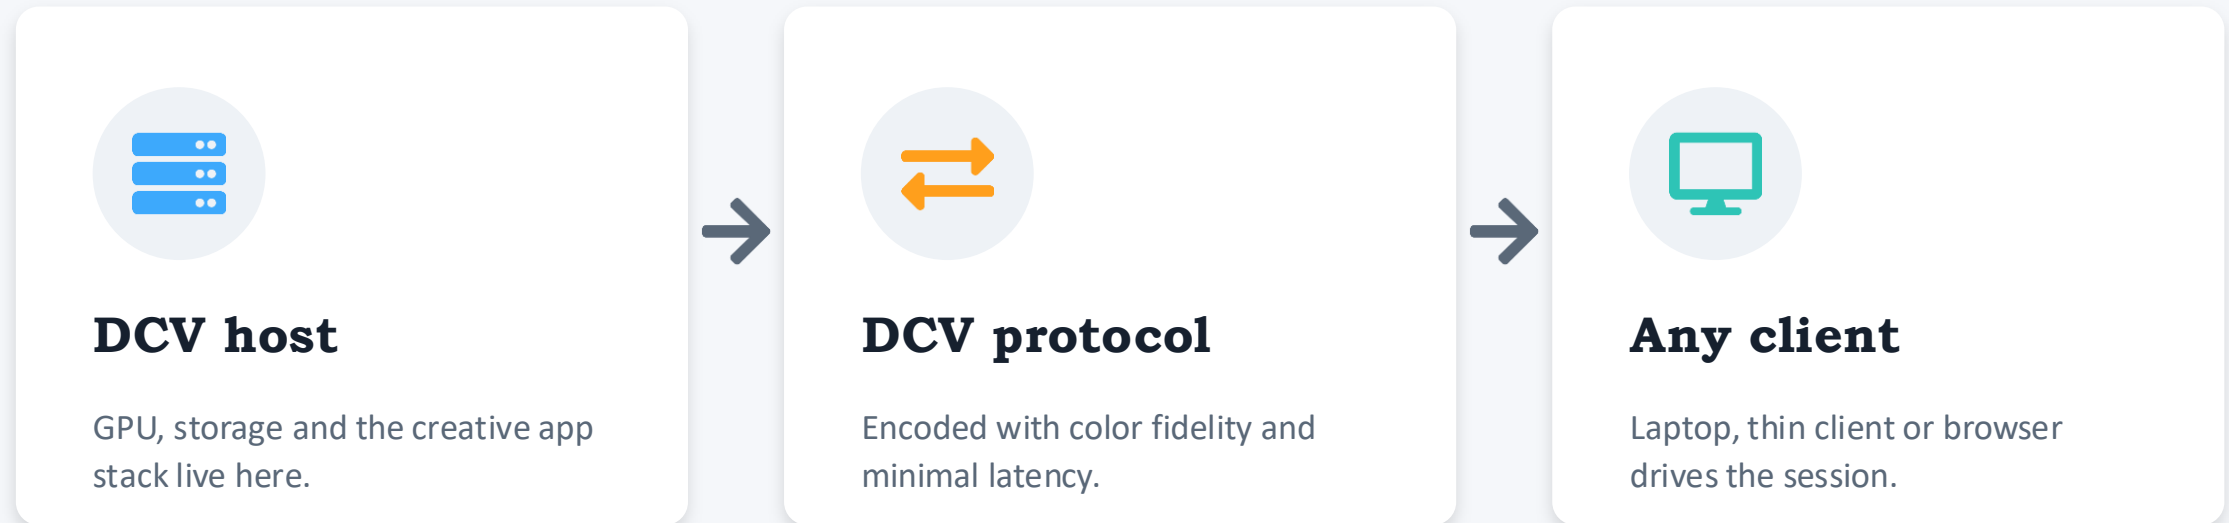

Input reliability

Server-side keyboard layout handling and smoother scroll behaviour.

THE SHAPE OF IT

Render stays put. Pixels travel.

Just enough of the picture to follow the demo — data and GPU stay in the studio or cloud; the artist drives a full session from anywhere.

That's the whole mental model. Everything else, you'll see live.

LIVE DEMO

Amazon DCV 2025.0, live

DEMO RUN-SHEET

1. Connect to the session

Browser or native client -> full creative desktop appears.

2. Show fidelity

Open a color-critical asset; pan / zoom; note no banding or lag.

3. Show interactivity

Scrub a timeline / orbit a 3D viewport — latency feels local.

4. Show 2025.0 niceties

WebAuthn login, keyboard layout fidelity, smooth scroll.

RECAP

What that demo proved

Latency that feels local

Interactive scrubbing and viewport work with no remote drag.

Color you can trust

Fidelity held up on a color-critical asset — no compromise.

Enterprise-grade access

Hardware-key auth and reliable input, production-ready today.

All of that, on the workstation stack studios run today.

IF THIS IS YOU

Mapping your hardware & protocol lifecycle?

If you're planning your studio's next few years of workstations and remote access, the pieces you just saw are the ones to anchor on.

Infrastructure teams

Keep enterprise remote performance intact through the desktop transition.

Studios & facilities

Plan workstation refresh and protocol choices with confidence.

Pipeline / systems leads

De-risk the lifecycle by betting on a proven, evolving protocol.

ONE MORE THING

What you saw runs on today's foundation.

The next foundation is already coming. We're getting DCV ready for it.

Watch this space.
