

AlmaLinux M&E

For You

Derive tailored builds from the official AlmaLinux M&E ISO — matched to your studio's hardware, software, and deployment scale.

THE PROBLEM

One ISO can't fit every studio

AlmaLinux M&E ships as a complete, ready-to-work image — but studios differ in hardware, app mix, and rollout scale. Getting from “official” to “production fleet” takes tailoring.

Hardware varies

GPUs, capture cards, and peripherals differ rack to rack and desk to desk.

App mix varies

Every studio has its own pipeline tools, plugins, and licensing footprint.

Deployment scale varies

A 3-seat boutique and a 300-seat facility roll out very differently.

THE STARTING POINT

Anatomy of the AlmaLinux M&E ISO

Everything ships in the box — AlmaLinux OS 10, KDE Plasma, and a curated set of open source media tools, ready to work offline.

AlmaLinux 10 base

Enterprise-grade stability, security, and long-term support underneath.

KDE Plasma desktop

A modern, configurable desktop tuned for creative workstations.

Curated media apps

Image, video, 3D, and audio tools selected and tested for the pipeline.

Fully self-contained

Packages and libraries are on the ISO — no network required to get to work.

WHAT WE'LL COVER

From official ISO to your own fleet

01

Why tailor it

The gap between the official ISO and your fleet.

02

Anatomy of the ISO

What's actually inside the AlmaLinux M&E build.

03

Customization levers

Packages, branding, hardware, deployment.

04

The build workflow

From official ISO to your own tailored image.

05

Live build walkthrough

We derive a custom image together.

06

From image to fleet

Testing and mass deployment.

The customization levers

Four places to adapt the official image — mix and match to fit your studio.

Package selection

Add, remove, or swap apps to match your pipeline exactly.

Branding & defaults

Wallpaper, menus, and default settings that feel like your studio.

Hardware & driver profiles

Tune GPU, capture, and peripheral support for your fleet's actual hardware.

Deployment & partitioning

Disk layout and rollout options built for how you actually deploy.

THE SHAPE OF IT

From official ISO to your image

Just enough of the process to follow the live build — the details, you'll see hands-on.

That's the whole mental model. Everything else, you'll see live.

LIVE WALKTHROUGH

Let's derive a build, live

DEMO RUN-SHEET

1. Start from the official ISO

Mount and inspect the AlmaLinux M&E deliverable.

2. Adjust the package set

Swap in studio-specific apps, drop what you don't need.

3. Set hardware & branding defaults

Driver profile, wallpaper, default settings.

4. Rebuild and boot the image

Produce your tailored ISO and boot it live.

From one image to a fleet

A tailored image is only useful if it deploys cleanly at scale.

Validate first

Boot, driver, and app checks before it ever reaches a rack.

Automate the rollout

Kickstart and PXE turn one image into consistent installs.

Version what you ship

Track image versions the same way you track pipeline releases.

You leave today with a booted image, not just a slide deck.

TAKE IT WITH YOU

Keep tuning it back at the studio

The build you made today is yours to keep customizing — and the SIG is where to bring questions.
