

Every Studio Size. Every Freelance Artist. Every Student, Empowered.

One year of building production-ready open-source infrastructure for Linux VFX and creative pipelines.

ORIGINS & PURPOSE

Born from the SIGGRAPH community

Spun off after direct discussions at SIGGRAPH 2024 and 2025 to close the gap between enterprise Linux stability and the rigid demands of studio pipelines.

Community first

Direct feedback from artists and studios at SIGGRAPH shaped the mission from day one.

From node to desk

Built for the full range — heavy render nodes through to color-critical artist workstations.

Enterprise base

AlmaLinux stability under the hood, without the rigid friction studios usually fight.

WHAT WE'LL COVER

One year, in six parts

01

Where we came from

SIGGRAPH origins and the studio-pipeline gap.

02

The testing year

AlmaLinux 10, Wayland, and remote desktop — one year of validation.

03

Wayland deep dive

Color accuracy, low latency, and the isolation tradeoffs.

04

Remote desktop

The render host, encode/stream, and the artist endpoint.

05

The hardware catalog

Crowdsourced reports, published and searchable in a minute.

06

Roadmap & how to help

What's next, and where you fit in.

THE TECH STACK OF TOMORROW

Testing toward the next frontier

AlmaLinux 10 + KDE Plasma

Comprehensive testing against the current enterprise base with a modern Plasma desktop.

Wayland support

Solving color-accurate, low-latency artist workflows on the modern display stack.

Remote desktop

Tackling the remote equation studios need — performance without compromise on fidelity.

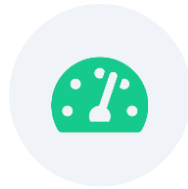

Wayland: why creative work is hard

Wayland is the future of the Linux desktop — but the things that make it secure and smooth are exactly the things color-critical pipelines have to solve carefully.

Color management

Getting ICC profiles and a predictable color pipeline to the compositor so what the artist sees is what renders.

Low latency

Frame pacing and input latency that hold up for interactive paint, edit and 3D viewport work.

Isolation tradeoffs

Wayland's security model restricts screen capture and input — great for safety, real work for capture-heavy tools.

The remote desktop equation

Studios increasingly keep data in the datacenter and stream the desktop to the artist. The workstation becomes a thin client — if the pixels arrive fast enough and accurate enough.

The hard parts: color-accurate encoding, sub-frame latency over real networks, and multi-monitor + tablet input passthrough.

COMMUNITY HARDWARE

Works On — the hardware catalog

A privacy-first community database — no hostnames or serials collected. Run one command, paste the result, and your rig is published for everyone.

REPORTS

9

UNIQUE GPUS

2

PLATFORMS

HOW IT WORKS

01

Run

One command collects hardware info locally.

02

Submit

Paste the JSON into the GitHub issue form.

03

Published

Validated and searchable within a minute.

kernelchief.github.io/almalinux-me-hardware-catalog

LIVE DEMO

Submit a rig in under a minute

DEMO RUN-SHEET

```
$ bash <(curl -sL .../almalinux-me-hardware-survey-reporter.sh)
```

1. Run the one-liner

Collects hardware locally, writes JSON, copies to clipboard.

2. GitHub issue form opens

Paste the JSON — no hostnames or serials are collected.

3. Submit → auto-validated → live

Searchable in the public database within a minute.

Use it today. Build it with us.

AlmaLinux 10 + KDE

Pre-built with the Creative Installer, ready out of the box for M&E work.

Wayland remote desktop

A full remote desktop solution built to support Wayland.

A growing app catalog

More apps landing soon — studios, freelancers, students, faster than ever.
